Abstract: This experiment used

Aldol Condensation, more specifically, double Claisen-Schmidt condensation in order to synthesize dibenzalacetone from benzaldehyde and acetone. In part one of the experiment, an aldol reaction occurred. In part two of the experiment, the product was

One of the key reactions used, the aldol condensation, features the reaction of two carbonyl compounds to form a new α -hydroxy carbonyl compound.1

This reaction can be performed under acid- or base-catalyzed conditions, and usually results in the formation of an α, β -unsaturated carbonyl compound.
