Solubility of copper sulphate at 90 o C is 67g/100g water, and 19g/100g water at 20 °C. Therefore for mass of crystals formed = 67 – 19 = 48g (for 100 cm 3 of solution). However, 200 cm 3 of solution was prepared. So total mass of copper sulphate crystallised = 2 x 48 = 96g. Solubility graph for gases:

The left side (y-axis) tells you how much solute can dissolve (in 100g of water) at a certain temperature (x-axis). The lines/curves indicate the maximum amount of solute which can be dissolved in 100g of water at each temperature. We call this a saturated solution. Any amount above the curve is said to be supersaturated; there is more solute than the solvent can hold, therefore the excess precipitates out/settles to the bottom.
