Charge comes in 2 types, positive and negative and is measured in Coulombs (C). If you have a charge on its own it emits a field in all directions. The field from a charge is represented by E as in E-lectricity. If you put another charge in the field it experiences a force. Like charges repel and unlike charges attract.

To summarise, electrostatics can be described in terms of two vector partial differential equations $\nabla \cdot \mathbf{E}(\mathbf{x}) = \rho(\mathbf{x})/\epsilon_0$ (1.9a) $\nabla \times \mathbf{E}(\mathbf{x}) = 0$ (1.9b) representing four scalar partial differential equations. Electromagnetic Field Theory - Physics Department

Electrodynamics is creating a magnetic field from an electric current. When electricity passed through a wire, a magnetic field is created around the wire. Looping the wire increases the magnetic field. Adding an iron core greatly increases the effect and creates an electromagnet. You can also create an electromagnet without the iron core.
