The Net Ionic Equation Lab dealt with many concepts involving ions as well as reactions. There are three types of reactions that can take place. One is a precipitation reaction that takes place when two soluble substances are mixed and form a precipitate or insoluble solid. Another is a neutralization reaction where two things react and form water.

From the balanced chemical reaction, the net ionic equation can be derived. The net ionic equation only includes the ions that participated in the reaction. It is formed by breaking down the strong acids and bases into ions, and removing the spectator ions, or the ions that did not change from the reactant side to that of the products. The remaining ions comprise what is called the net ionic equation.
