Energy Conservation

Conservation of Energy. In a closed system, where no energy is added and none can escape, the total energy in that system must remain constant. When energy is converted from one form to another, the total energy before the change has to equal the total of all energies after the change. It is not possible to create or destroy energy.

Notes: Energy is a conserved quantity: it can change forms and be transferred from one place to another, but it cannot be created or destroyed. For a process where energy changes forms or gets transferred, we can say that total energy before the process is equal to total energy after, or. $E_i = E_f$.

~~Physics Conservation Of Energy Study Guide Answers~~

According to the law of energy conservation: Energy can neither be created nor destroyed; however it can be converted from one form of energy to the other. Also, we know that energy is conserved in elastic collision. Obviously, a loss in energy during a collision will imply that the collision was inelastic.

The law of conservation of energy is a very important law in thermodynamics study in Physics. According to it energy can neither be created nor be destroyed. But we may transform it from one form to another. If we take all forms of energy into consideration, then the total energy of an isolated system always remains constant.

mechanical energy is conserved. When a simple pendulum oscillates with simple harmonic motion, it gains some kinetic energy because of this type of motion. As the pendulum swings back and forth, there is a constant exchange between kinetic energy and gravitational potential energy.

Law of Conservation of energy: This law of conservation of energy is a fundamental law of physics and chemistry. According to the Law of Conservation of Energy "The energy can neither be created nor be destroyed, can only be transferred from one form to another" or it can be described as "in a closed system, the energy of interacting bodies or particles always remains
